

Business Problem Statement

Retail businesses generate a large amount of customer shopping data every day, but raw data alone does not help in making business decisions. The company wants to understand customer purchasing behavior, product performance, sales trends, and the impact of discounts on customer purchases. However, the available data is not organized in a way that allows easy analysis. The goal of this project is to clean and transform the data, analyze it using SQL, and create interactive dashboards that help stakeholders identify useful business insights and support better decision-making.

Project Deliverables

1. Cleaned and transformed dataset ready for analysis.
2. Jupyter Notebook containing data cleaning and preprocessing steps.
3. MySQL database with the processed data loaded successfully.
4. SQL queries used to answer business questions and generate insights.
5. Analysis of customer behavior, purchasing patterns, and sales performance.
6. Interactive Power BI dashboard with key metrics and visualizations.
7. Summary of findings and actionable business insights for decision-making.
